Full-stack engineer with 2+ years of production experience building consumer web products — Next.js, TypeScript, AWS. Proven track record shipping revenue-critical features, leading frontend architecture, and migrating legacy codebases at scale.

WORK EXPERIENCE

Software Engineer, Ultraviolette Automotive

August 2024 – Present

- **Architecture Overhaul:** Spearheaded end-to-end migration of a legacy JavaScript codebase into a strictly typed TypeScript monorepo (TurboRepo), introducing compilation constraints, validation schemas, and global state management (Jotai) — governing **2,800+ production Pull Requests**.
- **Revenue-Critical Frontend:** Engineered the core multi-zone Next.js digital configurator for the flagship web presence, directly driving direct-to-consumer revenue pipelines and international customer acquisition flows.
- **Serverless Infrastructure:** Designed and integrated backend serverless components using AWS Lambda, API Gateway, and S3, with scalable DynamoDB single-table design schemas for high-performance normalized data storage.
- **Security:** Discovered and patched a critical user session authentication vulnerability, restructuring the core application layer into a modular, secure, and resilient posture.
- **Spark Award (June 2025):** Sole recipient on a cross-functional team for delivering the Isle of Man web project across multiple phases under a week of total execution time — unblocking critical auth session management failures, resolving frontend integration issues including font loading, Next.js rewrite configuration, and dashboard refinements.

Contract Software Engineer, Suggaa Ventures

May 2023 – March 2024

- **Full-Stack Delivery:** Built core user flows for the primary web platform including high-volume payment processing modules and dynamic cancellation trees using Next.js and server-side state.
- **Performance:** Reduced payment routing complexity and application bundle size by **40%**, improving web performance metrics and reducing conversion drop-offs at checkout.
- **Data Automation:** Engineered Node.js automation and scraping scripts to extract, normalize, and cache real-time pricing data from 4 ride-hailing services to train dynamic fare algorithms.

SKILLS

Frameworks & Libraries	React, Next.js, Node.js, tRPC, Prisma, Jotai, Framer Motion, Tailwind CSS
Languages	TypeScript, JavaScript, SQL, Python, Java, HTML/CSS
Tools & Architecture	AWS (Lambda, DynamoDB, API Gateway, S3), PostgreSQL, TurboRepo, Vercel, Git, CI/CD

EDUCATION

2020 – 2024 Bachelor of Engineering (ISE) at **JSSATE, Bangalore**

PROJECTS

Autom8r — AI Workflow Automation Platform — [GitHub](#) | [Live Demo](#)

- **Workflow Engine:** Architected a visual, node-based automation builder on Next.js, tRPC, and Prisma/PostgreSQL, enabling users to chain triggers (Stripe, Google Forms), AI models (OpenAI, Anthropic, Gemini), and integrations (Slack, Discord) into reusable workflows.
- **Execution & Extensibility:** Engineered an event-driven execution engine using **Inngest** with topological-sort-based node ordering and a pluggable executor registry, allowing new node types to be added without modifying the core engine.

use-content — Open Source React Hook — [GitHub](#) | [npm](#)

- **Developer Tooling:** Built and published a lightweight, type-safe React hook (@riganb/use-content) that injects a live content-editing panel in dev/staging environments, enabling marketing and design teams to iterate on copy directly in the browser with zero engineering intervention.
- **Zero Production Overhead:** Engineered an environment-aware compilation entry pivot using tree-shaking — the entire dev panel is automatically stripped at build time, adding **less than 1 kB** to production bundles.

Serverless Notification & Secure Verification Pipeline — Freelance — Maven Consultancy Services

- **Serverless Architecture:** Built an end-to-end dispatch platform using Next.js, decoupling heavy processing loads via **AWS API Gateway** and asynchronous **AWS Lambda** functions.
- **Automated Workflows:** Developed a Lambda microservice ecosystem to compute validation data, generate secure QR codes, and trigger high-volume transactional emails via **MailerSend**.

Enterprise Workforce Logistics & Analytics Engine — Freelance — Pee Empro Exports

- **Process Automation:** Built a low-latency Java logging client for on-site personnel tracking with offline-resilient QR pipelines and optimized CSV parsing.
- **Operational ROI:** Consolidated fragmented paper-trail metrics into a single-view dashboard, cutting administrative data-entry costs by **90%**.
